Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	26-05-2025
Team ID	
Project Name	Freelance Finder
Maximum Marks	4 Marks

Technical Architecture:

The Freelance Finder platform is designed with a scalable 3-tier architecture that includes the presentation layer (frontend), business logic (backend), and data storage layer. The solution ensures performance, security, and ease of integration with third-party APIs (e.g., Stripe for payments).

Table-1 : Components & Technologies:

S. No	Component	Description	Technology
1	User Interface (Frontend)	Responsive web interface for moviegoers and cinema administrators featuring interactive seat maps and digital M-tickets	React.js, Vite, Tailwind CSS, React Router v6
2	Application Logic-1 (Core API)	RESTful API managing movie & theatre catalogs, showtime scheduling, atomic seat locking, and checkout workflows	Node.js, Express.js
3	Application Logic-2 (Admin & Background Services)	Administrative command dashboard, live revenue auditing, automated seat lock reclamation, and transactional email dispatches	React.js, Node.js, node-cron, Nodemailer

S.No	Component	Description	Technology
1	User Interface (Frontend)	Responsive web interface for moviegoers and cinema administrators featuring interactive seat maps and digital M-tickets	React.js, Vite, Tailwind CSS, React Router v6
4	Database Layer	Scalable NoSQL persistence for user profiles, cinema halls, screening schedules, seat layouts, bookings, reviews, and watchlists	MongoDB, Mongoose ODM

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
5.	Open-Source Frameworks	Frontend frameworks, Backend framework	React.js, Node.js, BootStrap, Tailwind CSS
6.	Scalable Architecture	3-tier architecture with RESTful APIs	MVC
